

Next Generation 911 –

A lifeline service based on the Internet - Are we ready for this?

Distinguished Experts Panel

Chair: Carol Davids, Illinois Institute of Technology

Panelists

- **Stephen Ashurkoff, General Dynamics**
- **Trey Forgety, National Emergency Numbers Association**
- **Barbara Kemp, Assure911**
- **Henning Schulzrinne, Columbia University; FCC**

Focus on the Access Network Provider

- Policy and regulatory
- Standards
- Early Adopter
- Current challenges: Examples include mobile location, indoor location, text

Problem Statement

- Emergency Services are traditionally accessed using telecommunications systems.
- As these telecommunications systems move to IP networks, the Web and to smart mobile devices, people expect to reach emergency services using all the expanded modes of communications these new methods afford, texting and sending real-time video to the emergency call center.

Problem Statement

- These centers and the networks that support them need technical standards, government policy, new networks and operations to meet the new demands. The National Emergency Numbers Association has adopted a set of standards and best practices to be used by emergency service providers.
- Building and securing the networks that will support NG911 services and creating the operations to make these services reliable requires expertise in many fields.
- This panel of experts will discuss the architectures, security, operations, and policies that are being developed to meet this need.

Policy and Regulatory: Environmental challenges

- Used to be simple: ILEC delivers calls to PSAP
- NG911 dates back 15 years
- “Overtaken by events”:
 - ILECs getting out of (TDM) voice business
 - very little SP innovation in voice
 - slow deployment of VoLTE
 - consumer behavior: voice → text-based
 - application behavior: standards-based → proprietary (apps, web interfaces)

Internet Engineering Task Force
Internet Draft
[draft-schulzrinne-sip-911-00.txt](#)
July 13, 2000
Expires: December 2000

Schulzrinne
Columbia U.

Providing Emergency Call Services for SIP-based Internet Telephony

NENA began the process of redesigning the 9-1-1 service system in 2000, with discussion among the Technical Committee leaders about future 9-1-1 needs and concepts to support them. In 2001, the NENA Board President and 1st VP inquired about whether the Technical Committee would pursue this effort as a NENA organizational goal. The following sequence is a general history of this effort.

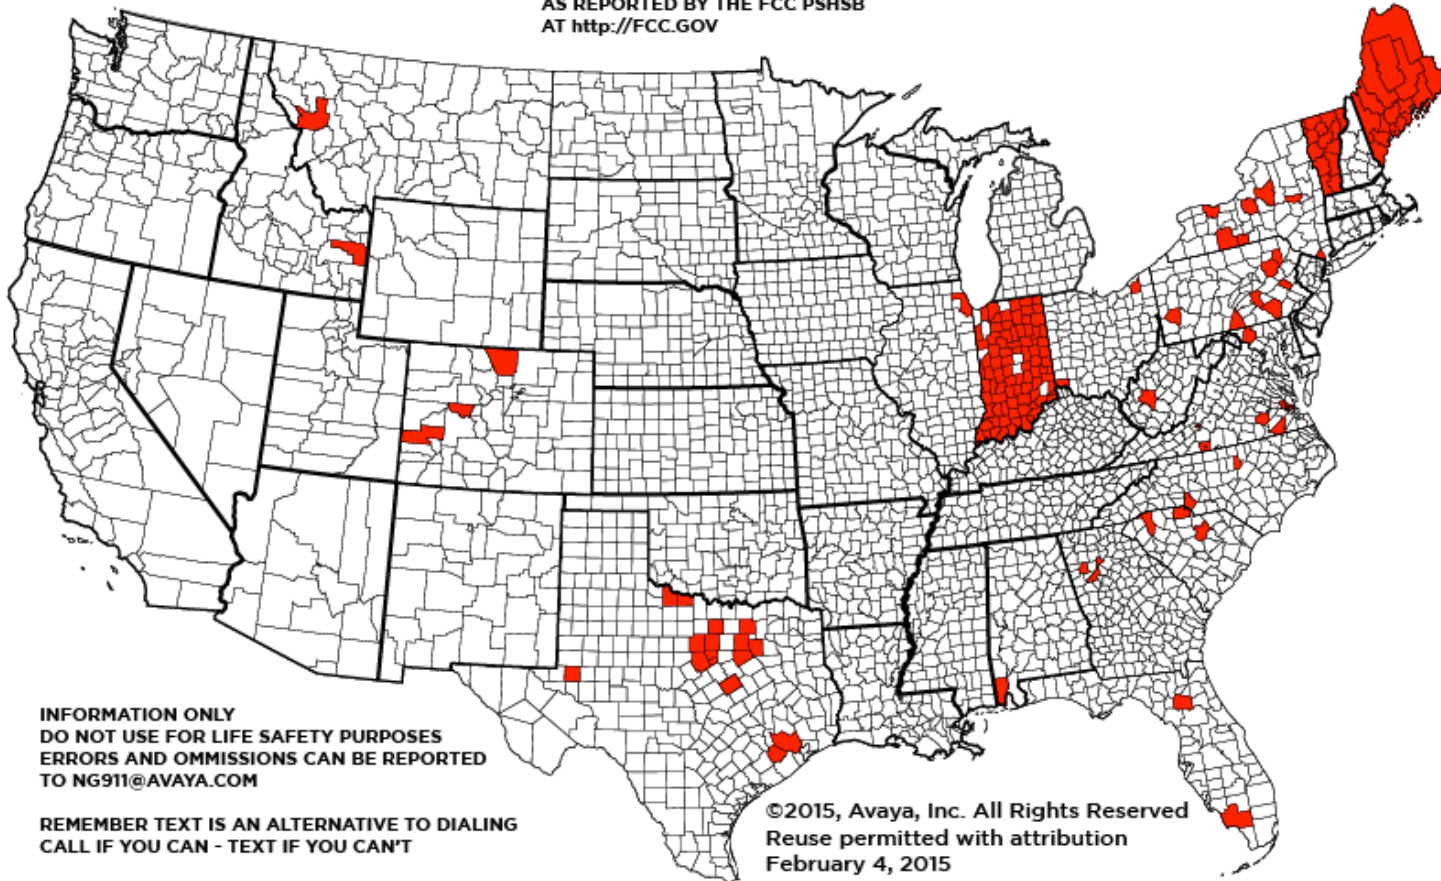

2001 Technical Committee leaders conceptualize the NENA Future Path Plan

Forever 20 years away: will we ever have a working nuclear fusion reactor?

Text-to-911

TEXT to 9-1-1 DEPLOYMENTS IN THE US AS OF FEBRUARY 4, 2015

AS REPORTED BY THE FCC PSHSB
AT <http://FCC.GOV>

INFORMATION ONLY
DO NOT USE FOR LIFE SAFETY PURPOSES
ERRORS AND OMISSIONS CAN BE REPORTED
TO NG911@AVAYA.COM

REMEMBER TEXT IS AN ALTERNATIVE TO DIALING
CALL IF YOU CAN - TEXT IF YOU CAN'T

Policy: Caller location

- Builds on long history of FCC location accuracy requirements
 - implicitly outdoor: 50m (67%)/150m (80%-90%) circles (1996), with geographic exclusions
- dispatchable location or x/y within 50 m
 - ~70% calls are wireless
 - unknown % indoor
 - residential indoor may allow GPS
- z axis:
 - 3 years: uncompensated barometric
 - 6 years: 80% of top 25 CMAs
- open issues:
 - nomadic iVoIP
 - separation of location & call delivery

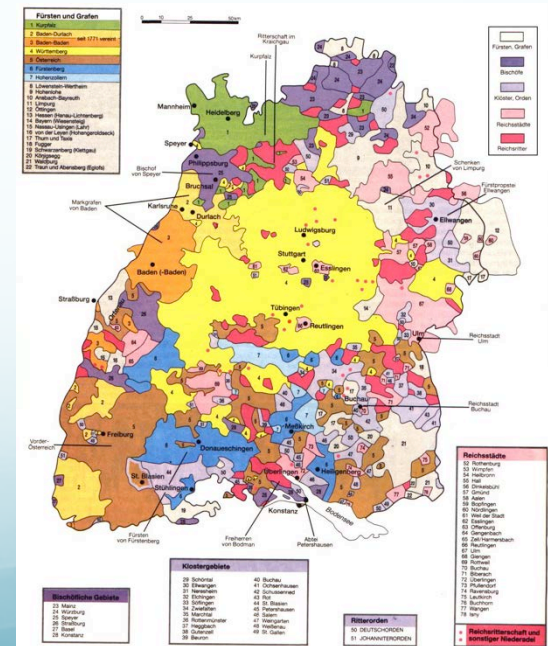

Alternative network models

- Current deployment model
 - network islands with SBC moats
 - one county, one network, one server rack, one purpose, one decade

Suomenlinna

- Similar to early academic Internet
 - Internet2
 - initially custom, then re-use dark fiber
 - membership model?

Alternative network models

old model: one 99.999% network

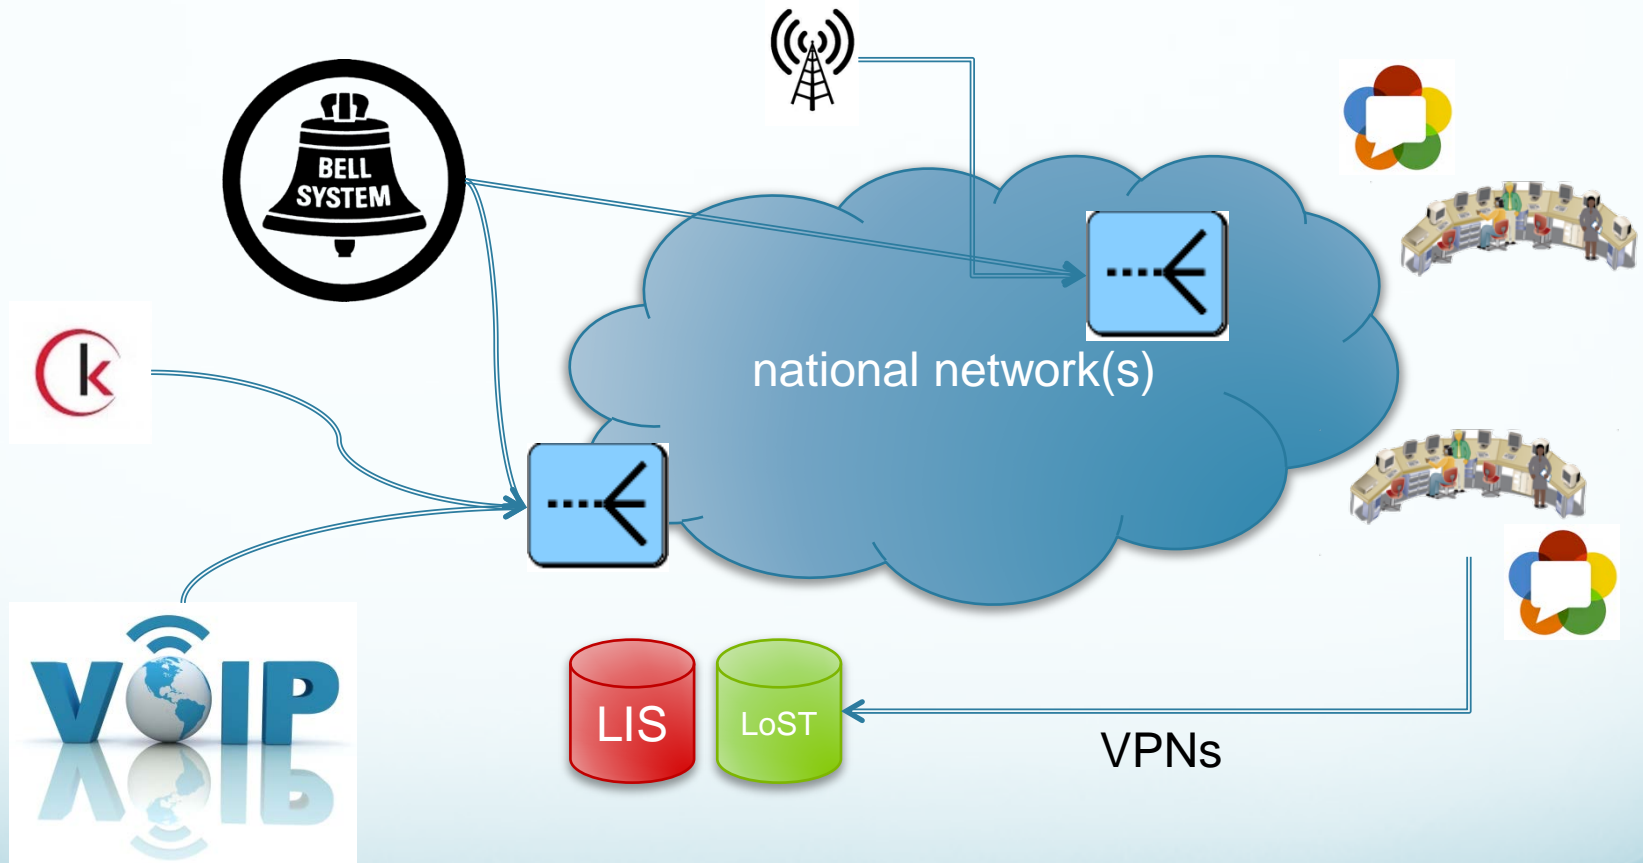

new model: 7 99% networks → 99.99999999999999% (in theory...)

4x

Alternative network models

major network interconnect points:
SEA, LAX, SJC, DEN, CHI, BOS, DC, NYC

Specifications and Standards

NENA Standards Work

- i3 – v.2 near-final
v.3 Candidate ANS
- NGSEC – Aligned to NIST Cybersecurity Framework
- Next-Gen Transition Planning Committee (Open)
- dev.nena.org

Specifications and Standards

Early Adoption

- State-Wide
 - Vermont – Unified, Hosted
 - Alabama – Federated
- Regional
 - Counties of Southern Illinois

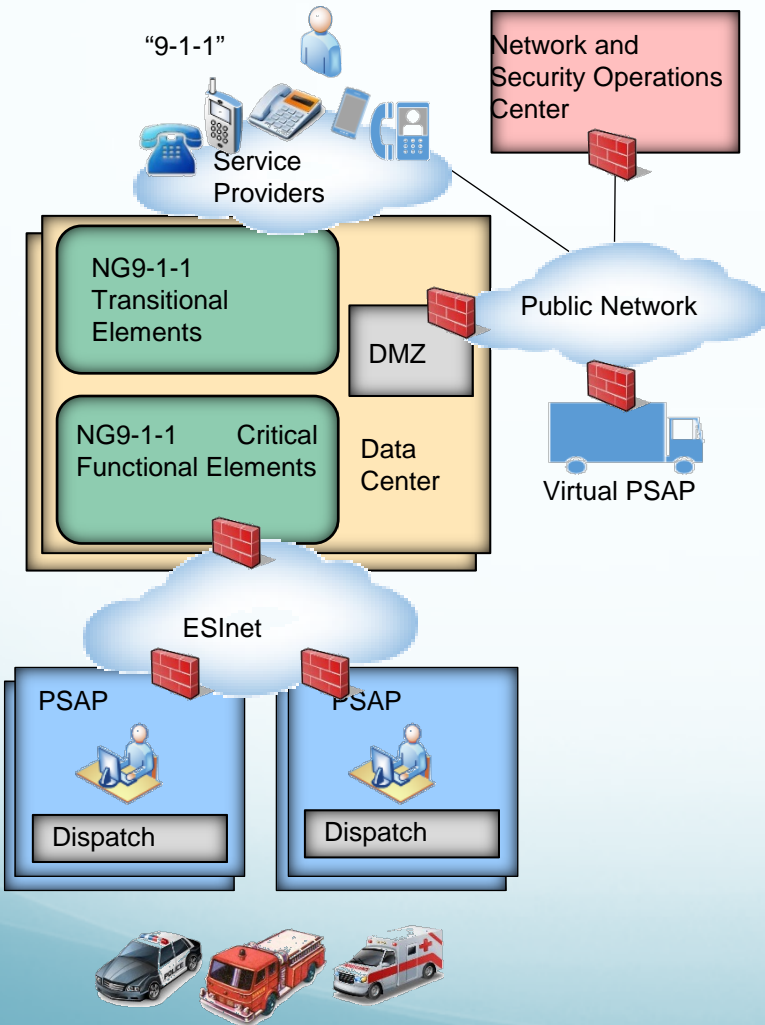

Specifications and Standards

Start Now! (or Regret it Later)

ANPs and OSPs *must* start thinking about 3 major transition elements:

- Service Discoverability for Early-Adopter OSPs
- Location Information Servers
- Media encoding at IX points
- www.nena.org/standards

NG9-1-1 & Access Providers: Dual Perspective

NG9-1-1 Design Objectives

- Efficiency through economies of scale
- Interoperability through industry standards
- Ability to Introduce new technology & services
- Improved survivability and resiliency

Originating Service Provider Responsibilities

- Routing of multi-media 911 traffic
- Prioritization of multi-media 911 traffic
- Authoritative location information with "call"
- Authoritative location information maintenance

Challenges - Counties of Southern Illinois NG9-1-1 Project – 2009 to 2015

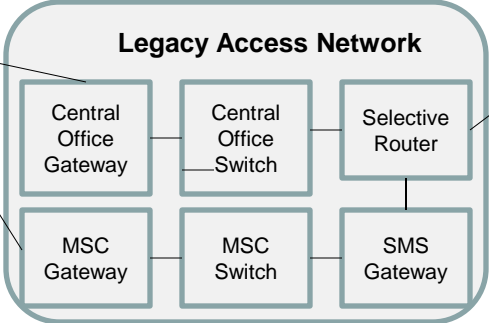

- Design and Engineering
 - ESInet, and Functional Elements – Eliminate Single Points of Failure
 - Diversity, Reliability, Resiliency
- Carrier Access Negotiations
 - Direct and Indirect Carrier Access Options
 - Signaling , Selective Routers and Transfers “the good the bad and the ugly”
- Illinois Commerce Commission Applications
 - Rules, Lessons Learned and Measurements
- Network Testing
 - IIT RTCL – ICE and Network Testing followed by Field Testing
 - Pre Cutover Border Control Functional Testing – Load and Overload
- End-to-End Testing
 - Tools – Wireshark, Protocol Analyses
 - Detailed Test Plans – Diagrams, Test Numbers, Cooperation, LERG, Database Readiness
- Cutover
 - Some things are harder than others – Wireless and VoIP Testing and Cutovers
 - Database issues – Testing and Default Routing
- Operations Surveillance and Alerting
 - Real Time Alerts – Database, PSAP, Network, Routers, Access, Transport, ESInet, FEs, Routers ,MIS
